LAB1

Analysis:

Account class have following attributes – accNo, name, balance, getters and setters for these, a method to compute interest. In AccManager1 class, accNo is directly provided (a.accNo) because of which it didn't concatenated with ICI, because of which his accNo is showing `004701. But in case of AccManager2 setter method is used to set accNo. So it get concatenated and final accNo is ICI004701.`
